A BUILD STORY

My tests never ran. Nobody noticed.

One line of config read like a promise. It was a filter.

SWIPE →

WHAT I WROTE

"branches: [main]". I read it as "gate what reaches main".

MYTH

PEOPLE SAY

“Run the tests on anything heading for main.”

ACTUALLY

It runs only when the pull request's base is main. Stacked on another branch? Skipped. Not failed.

WHAT IT COST

Its first real run went **red immediately**. On a real bug.

THE LIST

The same genre, in your setup

- ⏰ **A cron job pointing at a renamed path**
- 📡 **A monitor watching a hostname that stopped resolving**
- 🧪 **A test file excluded by a tightened glob**

THE MORAL

Config that reads like intent can be a narrow filter. Quiet looks exactly like fine.
