SAME CHECK, TWO DESIGNS

Give "I don't know" its own answer

A check with two answers will lie to you with one of them.

SWIPE →

BEFORE: TWO ANSWERS

Network hiccup? That's an **outage report**. Every time.

❌ Two states

0 pass, 1 fail. Not knowing gets folded into one of them.

✅ Three states

0 a run exists. 1 never tested. 2 I could not find out.

2

The exit code that says "the checker is the problem", not the thing it checks.

AFTER

"Broken" and "couldn't tell" get different responses.

THE MORAL

Systems that can't say "I don't know" will say something else. Usually the reassuring thing.
