SAME ERROR, TWO HABITS

# Green CI. Wrong fix.

Production said one thing. My laptop said another. I shipped anyway.

**invalid byte sequence in UTF-8**

HABIT 1: CLOSE ENOUGH

## I reproduce it locally and get **US-ASCII** instead.

**Same neighbourhood. Must be the locale.**

HABIT 1: THE RESULT

# I ship a locale fix. CI goes green.

Fixed it!

**Wrong twice over. It looked done for about a day.**

HABIT 2: EXACT MATCH

# The local repro has to say **UTF-8** too. It doesn't.

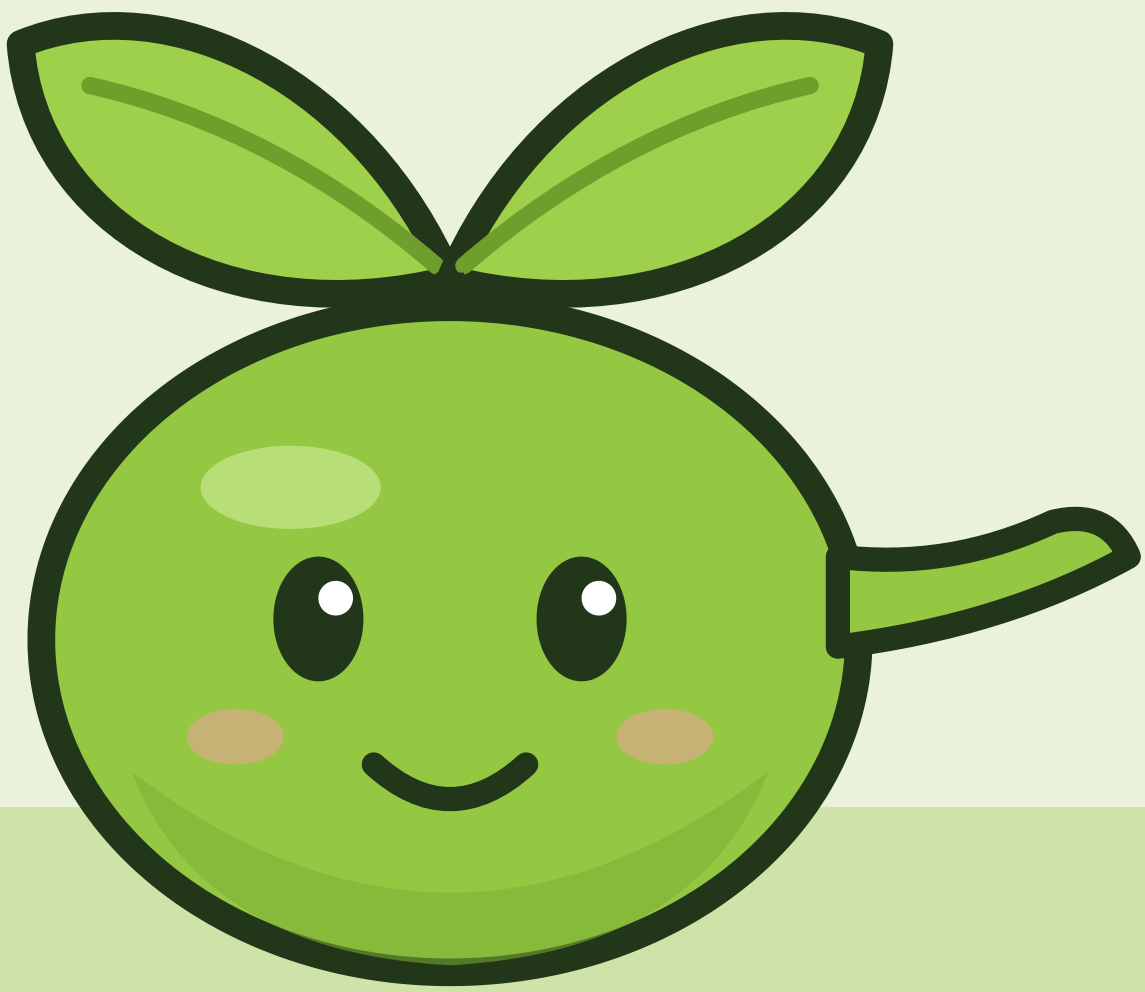

**That gap is the finding, not a footnote.**

HABIT 2: THE FIX

**Find where the byte comes in. Scrub it at that one place.**

**Plus a test that writes the exact byte.**

THE MORAL

# Reproduce the error in front of you, not one that resembles it.
